& Accessories

## Ballscrews

### Ballscrews & Accessories

Ballscrews consist of a shaft, a nut into which the balls are integrated and the ball recirculation system. Ballscrews are the type of threaded shaft most commonly used in industrial and precision machines. They are used to convert rotary motion into longitudinal motion and vice versa. They display great accuracy and are highly efficient. HIWIN provides a large selection of ballscrews suitable for all your applications.

HIWIN ballscrews are distinguished by their low-friction and precise running, require little drive torque and offer good rigidity with smooth operation. HIWIN ballscrews are available in rolled, peeled and ground versions making them the optimum product for any application.

## 1. Product overview

### Rolled ballscrews

Page 34

- Flange nuts and cylindrical nuts
- Reduced axial play available
- Nominal diameter 8 – 63 mm
- Standardised end machining

### Peeled ballscrews

Page 39

- Flange nuts and cylindrical nuts
- Single and double nuts
- Nominal diameter 16 – 80 mm
- Standardised end machining
- Safety nuts

### Ground ballscrews

Page 48

- Flange nuts and cylindrical nuts
- Single and double nuts
- Nominal diameter 6 – 100 mm
- Preloaded or minimum axial play

### Ballscrews for special requirements

Page 60

- Driven nut unit
- Ballscrews for heavy-duty operation

### Shaft ends and accessories

Page 62

- Standard end machining
- Standard spindle bearings
- Nut housing

### Ball spline

Page 88

- Flange nuts with integrated bearing
- Combination of ball spline nut and ballscrew nut
- Ball spline as full or hollow shaft
- Nominal diameter 16 – 32 mm

# Ballscrews

## General information

### 2. General information

#### 2.1 Properties

There are many benefits associated with HIWIN ballscrews including high efficiency, freedom from axial play, high rigidity and high lead accuracy. The characteristic properties and benefits of HIWIN ballscrews are described in detail below.

##### 2.1.1 High efficiency in both directions

Thanks to the rolling contact between the shaft and nut, ballscrews can achieve an efficiency of up to 90 %.

The special surface treatment used on the ball tracks in HIWIN ballscrews reduces the frictional resistance between the ball and track.

The rolling motion of the balls only requires a low drive torque thanks to the high level of efficiency. Operating costs are therefore cut since less drive output is needed.

- 1 Linear to rotary motion
- 2 Ballscrews Rotary to linear motion
- 3 Ballscrews
- $\mu$  Efficiency [%]
- $\varphi$  Lead angle [°]
- $\varphi_N$  Lead angle for common transmission [°]
- $\varphi_U$  Lead angle for reverse transmission [°]

Fig. 2.1 Mechanical efficiency of threaded shafts

##### 2.1.2 Zero play and high rigidity

The pointed profile HIWIN uses for ballscrew shafts and nuts allows the ballscrew nuts to be assembled without any axial play. A preload is usually used to achieve the good overall rigidity and repeatability.

Fig. 2.2 Typical types of contact in ballscrews (semi circular type, Gothic type)

##### 2.1.3 High lead accuracy

For applications requiring very high levels of accuracy, our production meets the requirements of ISO and JIS standards; but we manufacture to customer specifications too.

Accuracy is guaranteed by testing with our laser measurement systems and documented for the customer.

## 2.1.4 Reliable service life

Whereas the life of standard screw drives is determined by wear on the contact surfaces, HIWIN ballscrews can be used virtually up until the end of the metal's fatigue life. Great care is exercised in development, choice of material, heat treatment and manufacturing, as is demonstrated by the reliability and resilience of HIWIN ballscrews over their nominal service life. With every kind of ballscrew, the service

life depends on several influencing factors including design aspects, material quality, maintenance and most importantly the dynamic load rating ( $C_{dyn}$ ). Profile accuracy, material properties and surface hardness are the fundamental factors affecting the dynamic load rating.

## 2.1.5 Low starting torque with smooth operation

The rolling friction of the balls in ballscrews only requires a very low starting torque. To achieve precise ball tracks, HIWIN uses a special design (adaptation factor) and special production procedures. This guarantees that the motor's drive torque remains in the range required.

Using computer-based measuring systems, the friction torque of every ballscrew is recorded and documented with great accuracy at HIWIN. Fig. 2.4 shows typical torque progress over travel.

In one particular step of manufacturing, HIWIN can check the profile of every single ball track. A sample report of this test is shown in Fig. 2.3.

Fig. 2.3 Ball arch profile testing at HIWIN

Fig. 2.4 Preload testing at HIWIN

## 2.1.6 Special solutions

HIWIN manufactures ballscrews in line with customer drawings or with HIWIN standard end machining. For the ballscrew definition the requirements on the project planning sheet must be documented and checked. This ensures that the ballscrew is ideally adapted to the requirements in place.

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

### 3. Structural properties and selection of HIWIN ballscrews

#### 3.1 Design information

- a) Select a suitable ballscrew for your application (see Table 3.6). The relevant requirements must be noted for installation. For precision-ground ballscrews with CNC machines, this means careful alignment and the corresponding type of installation; for applications requiring less precision, we recommend rolled ballscrews, which require less work when designing the type of installation and bearings.

Fig. 3.1 **Uneven load distribution**, caused by insufficient alignment of support bearing and ballscrew nut, incorrect configuration of mounting surface, incorrect angle or error in aligning the nut flange

- b) It is particularly important that the bearing housing and ballscrew nut are assembled axially parallel; otherwise uneven load distribution would result. Radial and torque loads are also among the factors which result in uneven load distribution (see Fig. 3.1). This can cause functional limitations and shorten the service life (see Fig. 3.2).

Fig. 3.2 **Impacts on life expectancy** of radial load caused by insufficient alignment

#### Ball nut – FSWXB2

##### Specifications:

Shaft diameter: 40 mm  
Lead: 10 mm  
Ball diameter: 6.35 mm  
Radial play: 0.05 mm

##### Conditions:

Axial force  $F_a$ : 3000 N  
Radial displacement: 0 mm

L Service life ratio  
 $L_r$  Real service life  
 $L_d$  Desired service life  
 $\delta\alpha$  Assembly inclination

- c) Select the right type of bearing for the ballscrew shaft. When used in CNC machines, we recommend angular ball bearings (angle = 60°) because of their higher axial load capacity and the fact that they permit zero-backlash or pre-loaded installation.

A selection of possible end machining processes and suitable floating and fixed bearings are listed in Chapter 8 onwards.

- d) Precautionary measures must be taken to stop the ballscrew nut once the useful path has been exceeded (see Fig. 3.3). Travel against an axial fixed stop results in damage.

Fig. 3.3 **Mechanical stop which prevents the travel distance from being exceeded**

- e) In environments with high levels of dust or metal debris, ballscrews should be provided with a telescopic or bellows shaft protection (see Fig. 3.4).

Fig. 3.4 **Telescopic or bellows shaft protection**

- f) When using an internal or end cap ball recirculation system, the ball thread must be cut to the end of the shaft. The diameter of the adjacent bearing journal must be around 0.5 – 1.0 mm less than the core diameter of the ball tracks  $d_r$  (see Fig. 3.5).

Fig. 3.5 **Special requirement of bearing journal with internal recirculation system**

- g) While surface-hardening the shafts, 2 to 3 thread turns are left unhardened on the two ends adjacent to the bearings so that connection modifications are possible. These areas are marked with the symbol in HIWIN drawings (see Fig. 3.6). Please contact HIWIN if you have special requirements for these areas.

Fig. 3.6 **Area of surface hardening on a ballscrew shaft**

- h) Excess preload results in increased friction torque which in turn causes heating and therefore a reduced service life. On the other hand, insufficient preload reduces rigidity and increases the risk of backlash. For details, see Sections 3.7 and 3.8.7.

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

### 3.2 Procedure for selecting a ballscrew

Table 3.1 shows the procedure for selecting a ballscrew. The usage requirements (A) can be used to determine the necessary ballscrew parameters (B). The ballscrew suited to the application can therefore be determined one step at a time following the information provided (C).

Step	Usage requirement (A)	Ballscrew parameter (B)	Reference (C)
1	Positioning accuracy	Lead accuracy	Table 4.1, Table 5.1, Table 6.1
2	Speed	Lead of screw drive	$p = \frac{v_{\max}}{n_{\max}}$
3	Total length of travel distance	Total length of thread	Total length = thread length + length of end machining Thread length = travel distance + length of nut + distance which cannot be used due to connection design (e.g. nut housing, bearing housing etc.)
4	1 Load conditions [%] 2 Speed conditions [%] ( $\leq 1/5$ C recommended)	Average axial load Average speed	Formulas F 3.4 – F 3.9
5	Average axial force	Preload	Formula F 3.5
6	1 Nominal service life 2 Average axial load 3 Average speed	Dynamic load rating	Section 3.8.2, "Service life"
7	1 Dynamic load rating 2 Lead of ballscrew 3 Critical speed 4 Speed limitation by $D_N$ value	Shaft diameter and nut type	Section 3.8.2, "Service life"
8	1 Diameter of ballscrew 2 Nut type 3 Preload 4 Dynamic load rating	Rigidity	Section 3.8.7, "Rigidity"
9	1 Ambient temperature 2 Length of ballscrew	Thermal deformation and final value of cumulative lead (T)	Section 3.8.8, "Thermal expansion"
10	1 Shaft rigidity 2 Thermal deformation	Preload	Section 3.8.8, "Thermal expansion"
11	1 Max. table speed 2 Max. start-up time 3 Configuration of ballscrew	Motor drive torque and configuration of motor	Section 3.8.3, "Drive torque and drive output of motor"

### 3.3 Ballscrew shafts

HIWIN offers rolled, peeled and ground ballscrews – depending on the application requirements. For the selection of the appropriate shaft the individual characteristics are listed in Table 3.2.

Table 3.2 Procedure for the selection of a ballscrew

	Rolled	Peeled	Ground
<b>Profile</b>			
<b>Manufacturing process</b>	Forming process	Cutting process	Grinding process
<b>Typical applications</b>	Transportation	Transportation and positioning	Positioning
<b>Tolerance classes</b>	T5 – T10	T5 + T7	T0 – T5
<b>Nominal diameter [mm]</b>	8 – 63	16 – 80	6 – 100
<b>Max. shaft length<sup>1)</sup> [mm]</b>	500 – 5,600	3,300 – 6,500	110 – 10,000
<b>Nut shapes</b>	Flange nut Cylindrical nut	Flange nut Cylindrical nut Double nut	Flange nut Cylindrical nut Double nut
<b>Availability</b>	From stock	From stock	Upon request

<sup>1)</sup> Depends on the diameter and the tolerance class

### 3.4 Ball recirculation systems

HIWIN ballscrews are available with three different recirculation systems.

The external recirculation system consists of the return tubes and the clamping plate. The balls are placed in the ball track between the ballscrew shaft and nut. At the end of the nut, they are guided out of the ball track and back to the start via a return tube; ball circulation is therefore a closed circuit (see Fig. 3.7).

Fig. 3.7 External recirculation type nut

In the case of the internal single recirculation, the balls are each fed back to the beginning of a thread turn with the help of the deflecting parts. The balls undertake just one circuit around the shaft. The circuit is closed by a deflecting part in the ballscrew nut and allows the balls to return to the start via the rear of the thread. The position of the ball deflection in the nut gives the internal single recirculation system its name (see Fig. 3.8).

Fig. 3.8 Internal single recirculation type nut

The third type of return is the cassette recirculation system shown in Fig. 3.9. It has the same basic principle as the external return, however, the balls are returned via a channel in the ballscrew nut. The balls perform one complete cycle in the ballscrew nut. The cassette return is also called "internal total recirculation".

Fig. 3.9 Cassette recirculation type nut

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

### 3.5 Wiper variants

#### **NBR wiper (N): the allrounder**

The nitrile rubber wiper offers excellent sealing and wiping properties for most environmental conditions and is therefore used in almost all applications.

#### **NBR-finger wiper (K): the one for the rough stuff**

Wherever stubborn dirt prevails, it really cleans up. The finger wiper with its hard plastic fingers should not be missing in environments with coarse dirt particles.

#### **Felt wiper (F): the most absorbent among the wipers**

Felt has the property of absorbing liquids, storing them and releasing them again. This gives the felt wiper an ideal wiping effect and provides additional lubrication.

#### **Felt-finger wiper (V): the duo**

With our duo, consisting of a felt wiper and a finger wiper, dirt – whether coarse or fine – has no chance.

	NBR (N)	Felt (F)	NBR-finger (K)	Felt-finger (V)
Temperature resistance		++		+
Soiling	+		++	+
Friction reduction	++		+	
Tightness	++		++	
Emergency running		++		++
Chemical resistance	++	+	+	+

3.6 Accuracy of the HIWIN ballscrews

3.6.1 Tolerance class

HIWIN ballscrews are produced in various tolerance classes depending on the application's accuracy requirements.

$T_p$	Difference between nominal and actual path. This value is determined by the various requirements of the customer's application.
$e$	Path deviation
$E_p$	Maximum actual path deviation from nominal path over complete distance.
$e_{2\pi p}$	Path deviation within one revolution
$E_a$	Actual path, determined using laser measurement
$e_p$	Actual path deviation. Maximum deviation of total actual path from actual total nominal path in the corresponding area
$e_{0a}$	Average actual path deviation
$l_0$	Useful path
$l_s$	Nominal path

Fig. 3.10 HIWIN measurement curve of lead of precision ballscrews

$l_0$	Useful path
$e$	Path deviation
$e_{300p}$	Actual path deviation at 300 mm. Actual path deviation over 300 mm at any thread position
$e_{0a} (E_a)$	Average actual path deviation over useful path $l_0$
$C (T_p)$	Path compensation over useful path $l_0$
$e_p (E_p)$	Limit deviation of nominal path
$v_{up} (e_p)$	Permissible path deviation over useful path $l_0$
$v_{300p} (e_{300p})$	Permissible path deviation over 300 mm
$v_{2\pi p} (e_{2\pi p})$	Permissible path deviation over one revolution

$l_0$	Useful path
$l_e$	Path outside of the nominal path
$L1$	Total thread length

Fig. 3.11 DIN ISO measurement curve of lead of ballscrews

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

### 3.6.2 Travel fluctuation over 300 mm travel distance

As an international company, HIWIN produces ballscrews on the basis of DIN ISO 3408 in tolerance classes 0, 1, 3, 5, 7 and 10 and in accordance with the Japanese standard JIS in classes 0, 2 and 4. The tolerance classes as well as the permissible travel fluctuation  $v_{300p}$  over 300 mm path are listed in Table 3.4.

Table 3.4 International standards for tolerance classes of ballscrews

HIWIN tolerance class		T0	T1	T2	T3	T4	T5	T7	T10
$v_{300p}$	DIN ISO	3.5	6	—	12	—	23	52	210
	JIS	3.5	—	8	—	18	—	—	—

Unit: [μm]

$v_{300a}$  Travel fluctuation over 300 mm at any position (measurement in accordance with DIN standard 69051-3-3)

Fig. 3.12 Travel fluctuation over 300 mm useful path

### 3.6.3 Path deviation and travel fluctuation over useful path

#### Positioning ballscrews

For positioning ballscrews (peeled and ground) the permissible path deviations over the useful path  $l_u$  are listed in Table 3.5.

Table 3.5 Tolerance classes of peeled and ground ballscrews

8,000	10,000											260	145
10,000	12,000											320	180

$e_p$  [μm] Path deviation: Limit deviation of nominal path  
 $v_{up}$  [μm] Travel fluctuation over useful path

## Transportation ballscrews

For transportation ballscrews (rolled) the permissible path deviation over the useful path (tolerance for desired path) can be calculated with Formula F 3.1.

F 3.1

$$e_p = \pm \frac{l_u}{300} \times v_{300p}$$

$e_p$  Path deviation: Limit deviation of nominal path  
 $l_u$  Useful path  
 $v_{300p}$  Permissible travel fluctuation over 300 mm path

## Curves of lead accuracy when measuring on a laser measuring device according to DIN ISO 3408

Fig. 3.13 Average path deviation over useful path  $l_u$

$l_u$  Useful path  
 $C$  Travel compensation  
 $e_p$  Path deviation: Limit deviation of nominal path  
 $e_{oa}$  Average deviation of actual path

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

### 3.7 Preload and play

The axial force  $F_a$ , caused by outer drive forces or inner preload forces, produces two kinds of axial play. Firstly, axial play  $S_a$ , that originates from the air between the ball and ball track. Secondly, the spring compression play  $\Delta l$ , caused by the force  $F_n$ , which acts vertically on the point of contact.

By default, rolled and peeled ballscrews are delivered with slight play. This is sufficient for most applications, and has the advantage that the ballscrews run smoothly and a low starting torque is required.

If increased demands are placed on the positioning accuracy and rigidity, the ballscrew should be used with no axial play or preloaded. For preloading, different methods are available, which are explained below.

Fig. 3.15 Gothic arch profile and preload

### 3.7.1 HIWIN types of preload

Preload can be generated either with double nuts, or single nuts with lead offset or in the case of preloaded single nuts by adjusting the ball size.

#### Preloaded single nuts

There are two kinds of preload for the single nuts. One of these is the "preload method with oversized balls". This involves balls which are slightly larger than the space in the ball tracks between spindle and nut; the ball therefore makes contact at four points (see Fig. 3.16).

Fig. 3.16 Preload from ball size

The other method is known as "preload from lead offset" (see Fig. 3.17). The nut is ground such that it is offset from the central lead. This type of preload takes the place of the classic double nut preload and offers the benefit that a compact single nut with good rigidity can be used with low preload forces. This method is not, however, suited to use with high preloads and high leads. The recommend preload force is less than 5% of the dynamic load rating (C).

Fig. 3.17 Preload from lead offset

## Preloaded double nuts

The preload is generated by inserting a spacer between the nuts (see Fig. 3.18). The 0 preload results from fitting an oversized spacer which pushes the halves of the nut apart. The X preload is generated with an undersized spacer which pulls the nuts together.

Fig. 3.18 Preload from spacer

## 3.7.2 Effects of preload

Preload increases the thread's friction torque and therefore causes increases in temperature during operation. To ensure a long service life and low increase in temperature, the maximum preload should not exceed 5 % of the dynamic load rating for single nuts and 10 % for double nuts.

Furthermore preload has an effect on the running characteristics. Besides an increase in idle torque it leads to fluctuations in idle torque, especially with ballscrews with high tolerance classes. (see Section 3.7.3).

Basically, ballscrews should only be preloaded when it is absolutely necessary to avoid axial play.

## 3.7.3 Idle torque fluctuation

### (1) Measuring method

Preload produces a friction torque between nut and threaded shaft. This is measured by moving the threaded shaft at constant speed while holding the nut with a special locking device (see Fig. 3.19).

The force  $F_{Pr}$  measured by the force sensor is used to calculate the idle torque of the threaded shaft.

$$T_d = \frac{K_p \times F_{Pr} \times P}{2000 \times \pi}$$

$T_d$  Idle torque of preloaded nut  
 $F_{Pr}$  Preload force  
 $P$  Lead  
 $K_p$  Preload friction coefficient  
 $K_p = \frac{1}{\eta_1} - \eta_2$  (between 0.1 and 0.3)

$\eta_1, \eta_2$  are the mechanical efficiencies of the ballscrew

### (2) Measurement conditions

1. Without wiper
2. Speed: 100 rpm
3. Dynamic viscosity of lubricant 61.2 – 74.8 cSt [mm/s] at 40 °C, complying with ISO VG 68 or JIS K2001

(3) The result of the measurement is displayed using standard depiction of idle torque; the nomenclature is shown in Fig. 3.19.

(4) Fluctuations in idle torque (incorporated in the tolerance class definition) are listed in Table 3.17.

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

Fig. 3.19 Nomenclature for measuring idle torques

Note:

1. Slenderness ratio = thread length of shaft/nominal diameter of shaft [mm]
2. To calculate the idle torque, see Formula F 3.2
3. For more information, please contact HIWIN

## 3.8 Calculations

Bases of calculations in accordance with DIN ISO 3408.

### 3.8.1 Load ratings

#### Dynamic load rating $C_{dyn}$ (theoretical)

The dynamic load rating describes the load at which 90 % of all ballscrews reach a life expectancy of  $1 \times 10^6$  revolutions (C). The reliability factor can be taken into account in accordance with Table 3.18. The dynamic load rating is listed in the dimensions tables for the nuts.

#### Static load rating $C_0$

The static load rating describes the load which causes permanent deformation of the ball track of more than 0.0001 of the ball diameter. In order to calculate the maximum static load rating, the static structural safety  $S_0$  of the application conditions must be taken into account.

$$F 3.3 \quad S_0 \times F_{amax} < C_0$$

$S_0$  Static structural safety  
 $C_0$  Static load rating (dimensions table for nut)  
 $F_{amax}$  Max. static axial load

### 3.8.2 Service life

#### a) Average speed $n_m$

$$F 3.4 \quad n_m = n_1 \times \frac{t_1}{100} + n_2 \times \frac{t_2}{100} + n_3 \times \frac{t_3}{100} + \dots$$

$n_m$  Average speed, total [rpm]  
 $n_n$  Average speed in phase n [rpm]  
 $t_n$  Amount of time in phase n [%]

#### b) Preload

$$F 3.5 \quad F_{pr} = \frac{f_{pr}}{100\%} \times C_{dyn}$$

$F_{pr}$  Preload force  
 $C_{dyn}$  Dynamic load rating  
 $f_{pr}$  Preload factor in %  
 Single nut  $f_{pr} \leq 5\%$   
 Double nut  $f_{pr} \leq 10\%$   
 $F_{lim}$  Disengagement force

$$F 3.6 \quad F_{lim} = 2^{3/2} \times F_{pr}$$

Distinction of cases:

$F_n > F_{lim}$  No influence from preload:  $F_{bn} = F_n$   
 $F_n < F_{lim}$  Influence from preload: Formula F 3.7

$$F 3.7 \quad F_{bn} = \left( 1 + \frac{F_n}{2^{3/2} \times F_{pr}} \right)^{3/2} \times F_{pr}$$

$F_n$  Axial loading in phase n  
 $F_{bn}$  Operating axial loading in phase n

$F_n$  must be calculated for all phases and used in Formula F 3.7.

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

### c) Average operating load $F_{bm}$

- With alternating load and constant speed

F 3.8

$$F_{bm} = \sqrt[3]{F_{b1}^3 \times \frac{t_1}{100} \times f_{p1}^3 + F_{b2}^3 \times \frac{t_2}{100} \times f_{p2}^3 + F_{b3}^3 \times \frac{t_3}{100} \times f_{p3}^3 \dots}$$

- $F_{bm}$  Average operating load [N]
- $F_{bn}$  Operating axial loading in phase n
- $f_p$  Operating condition factor
- $f_p$  1.1 – 1.2 operation without impact
- 1.3 – 1.8 operation under normal conditions
- 2.0 – 3.0 operation with high impact and with vibrations
- 3.0 – 5.0 short-stroke applications  $< 3 \times$  nut length

- With alternating load and alternating speed:

F 3.9

$$F_{bm} = \sqrt[3]{F_{b1}^3 \times \frac{n_1}{n_m} \times \frac{t_1}{100} \times f_{p1}^3 + F_{b2}^3 \times \frac{n_2}{n_m} \times \frac{t_2}{100} \times f_{p2}^3 + F_{b3}^3 \times \frac{n_3}{n_m} \times \frac{t_3}{100} \times f_{p3}^3 \dots}$$

### d) Axial loading on both sides:

- Service life in revolutions

F 3.10

$$L_1 = \left( \frac{C_{dyn}}{F_{bm1}} \right)^3 \times 10^6$$

$$L_2 = \left( \frac{C_{dyn}}{F_{bm2}} \right)^3 \times 10^6$$

- $L_1$  Service life in revolutions, forward motion
- $L_2$  Service life in revolutions, backward motion
- $C_{dyn}$  Dynamic load rating [N]
- $F_{bm1}$  Average operating load, forward motion
- $F_{bm2}$  Average operating load, backward motion
- $L$  Service life in revolutions

F 3.11

$$L = \left( L_1^{-10/9} + L_2^{-10/9} \right)^{-9/10}$$

- Conversion of service life into operating hours

F 3.12

$$L_h = \frac{L}{n_m \times 60}$$

- $L_h$  Service life in operating hours
- $n_m$  Average speed [rpm], see Formula F 3.4

- Conversion of distance travelled [km] into operating hours:

F 3.13

$$L_h = \left( \frac{L_{km} \times 10^6}{P} \right) \times \frac{1}{n_m \times 60}$$

- $L_h$  Service life in operating hours
- $L_{km}$  Service life in distance travelled [km]
- $P$  Lead [mm]
- $n_m$  Average speed [rpm]

- The modified service life with different reliability factors is calculated using

F 3.14

$$L_m = L \times f_r$$

$$L_{hm} = L_h \times f_r$$

- $f_r$  Reliability factor (see Table 3.18)

Resilience %	Reliability factor $f_r$
90	1.00
95	0.63
96	0.53
97	0.44
98	0.33
99	0.21

Flow chart for calculating service life

3.8.3 Drive torque and drive output of motor

Fig. 3.20 shows the influencing parameters of a feed system with ballscrew. Below you will find the formula for calculating the drive torque required of the motor:

- (1) Motor, (2) Gear 1, (3) Gear 2, (4) (Friction force + operation force),
- (5) Ballscrew

Fig. 3.20 Load trend of a system with ballscrew

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

- Normal operation (conversion of rotary motion into linear motion)

**F 3.15**

$$T_a = \frac{F_w \times P}{2,000 \times \pi \times \eta_1}$$

- $T_a$  Drive torque for normal operation [Nm]
- $T_c$  Drive torque for reverse operation [Nm]
- $F_w$  Effective axial load [N], friction force + operating force
- $P$  Lead [mm]
- $\eta_1$  Mechanical efficiency (0.85 – 0.95), normal operation
- $\eta_2$  Mechanical efficiency (0.75 – 0.85), reverse operation

- Reverse operation (conversion of linear motion into rotary motion)

**F 3.16**

$$T_c = \frac{F_w \times P \times \eta_2}{2,000 \times \pi}$$

- Drive torque of motor
- For normal operation:

**F 3.17**

$$T_M = (T_a + T_b + T_d) \frac{N_1}{N_2}$$

- $T_M$  Motor drive torque [Nm]
- $T_b$  Friction torque of support bearing [Nm]
- $T_d$  Idle torque [Nm]
- $N_1$  Number of teeth on driving gear wheel
- $N_2$  Number of teeth on driven gear wheel

For acceleration:

**F 3.18**

$$T'_a = J \times \alpha$$

- $T'_a$  Motor drive torque during acceleration [Nm]
- $J$  Inertia torque of system [Nm<sup>2</sup>]
- $\alpha$  Angular acceleration [rad/s<sup>2</sup>]
- $t_a$  Acceleration start-up time [s]
- $n_1$  Initial speed [rpm]
- $n_2$  Final speed [rpm]

**F 3.19**

$$\alpha = \frac{2\pi \times \Delta n}{60 \times t_a}$$

**F 3.20**

$$\Delta n = n_2 - n_1$$

**F 3.21**

$$J = J_M + J_{G1} + J_{G2} \times \left(\frac{N_1}{N_2}\right)^2 + \frac{1}{2} m_r \times \left(\frac{d_n}{2000}\right)^2 \times \left(\frac{N_1}{N_2}\right)^2 + m_l \times \left(\frac{P}{2000\pi}\right)^2 \times \left(\frac{N_1}{N_2}\right)^2$$

= motor inertia + equivalent gear inertia + inertia of ballscrew (see Fig. 3.20)

- $m_r$  Mass of rotating parts [kg]
- $m_l$  Mass of components moved in linear fashion [kg]
- $d_n$  Nominal diameter of ballscrew [mm]
- $J_M$  Motor inertia [kgm<sup>2</sup>]
- $J_{G1}$  Inertia of drive gear [kgm<sup>2</sup>]
- $J_{G2}$  Inertia of driven gear [kgm<sup>2</sup>]

Total drive torque:

**F 3.22**

$$T_{Ma} = T_M + T'_a$$

- $T_{Ma}$  Total drive torque [Nm]

○ Drive output

**F 3.23**

$$P_A = \frac{T_{pmax} \times n_{max}}{9,550}$$

○ Acceleration time check

**F 3.24**

$$t_a = \frac{J}{T_{M1} - T_L} \times \frac{2\pi \times n_{max}}{60} \times f$$

- $P_A$  Maximum reliable drive output [kW]
- $T_{pmax}$  Maximum drive torque (safety factor  $\times T_{max}$ ) [Nm]
- $n_{max}$  Maximum speed [rpm]
- $t_a$  Acceleration start-up time [s]
- $J$  Total inertia torque [kgm<sup>2</sup>]
- $T_{M1}$  Nominal torque of motor [Nm]
- $T_L$  Drive torque at nominal speed [Nm]
- $f$  Safety factor = 1.5

### 3.8.4 Buckling load

**F 3.25**

$$F_k = 4.072 \times 10^5 \left( \frac{f_k \times d_k^4}{l_s^2} \right)$$

**F 3.26**

$$F_{kmax} = 0.5 \times F_k$$

- $F_k$  Permissible load [N]
- $F_{kmax}$  Max. permissible load [N]
- $d_k$  Core diameter of threaded shaft [mm]
- $l_s$  Unsupported shaft length [mm] (see Fig. 3.21)
- $f_k$  Factor for different types of assembly (buckling load)

Fixed bearing – fixed bearing	$f_k = 1.0$
Fixed bearing – supported bearing	$f_k = 0.5$
Supported bearing – supported bearing	$f_k = 0.25$
Fixed bearing – no bearing	$f_k = 0.0625$

### 3.8.5 Critical speed

**F 3.27**

$$n_k = 2.71 \times 10^8 \left( \frac{f_n \times d_k}{l_s^2} \right)$$

**F 3.28**

$$n_{kmax} = 0.8 \times n_k$$

- $n_k$  Critical speed [rpm]
- $n_{kmax}$  Max. permissible speed [rpm]
- $d_k$  Core diameter of threaded shaft [mm]
- $l_s$  Unsupported shaft length [mm] (see Fig. 3.21)
- $f_n$  Factor for different types of assembly (critical speed)

Fixed bearing – fixed bearing	$f_n = 1.0$
Fixed bearing – supported bearing	$f_n = 0.692$
Supported bearing – supported bearing	$f_n = 0.446$
Fixed bearing – no bearing	$f_n = 0.147$

Fig. 3.21 Definition of “Unsupported shaft length”

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

Fig. 3.22 Buckling load for different diameters and lengths of threaded shafts

Fig. 3.23 Critical speed for different diameters and lengths of threaded shafts

### 3.8.6 $D_N$ value for working speed of a ballscrew

The specific speed value  $D_N$  has a huge influence on the behaviour of the ballscrew in terms of noise and heat development and service life of the recirculation system.

For HIWIN ballscrews

**F 3.29**  $D_N = d_s \times n_{max}$

- $D_N \leq 90,000$  for ballscrews with cassette recirculation
- $D_N \leq 120,000$  for ballscrews with cassette recirculation and no axial play
- $D_N \leq 150,000$  for high-speed ballscrews (upon request)

### 3.8.7 Rigidity

Rigidity describes the flexibility of a machine element. The overall rigidity of a ballscrew is determined by the axial rigidity of the nut/shaft system, the contact rigidity of the ball track and the rigidity of the threaded shaft. The following factors should also be taken into account when fitting the ballscrew in a machine: rigidity of support bearings, assembly conditions of nuts with table etc.

The rigidity of the nut/shaft unit and the ball and ball track can be combined to produce the rigidity of the nut  $R_n$ , which is listed in the dimensions tables for the different types of nuts.

- Rigidity of a ballscrew

**F 3.30**  $\frac{1}{R_{bs}} = \frac{1}{R_s} + \frac{1}{R_n}$

- $l_s$  Unsupported shaft length [mm]
- $F_{kmax}$  Critical axial load [N]
- $n_k$  Critical speed [rpm]
- FB Fixed bearing
- FR Free
- SB Support bearing
  
- $d_s$  Shaft diameter [mm]
- $n_{max}$  Max. speed [rpm]

- $R_{bs}$  Overall rigidity of a ballscrew [N/ $\mu$ m]
- $R_s$  Rigidity of threaded shaft [N/ $\mu$ m]
- $R_n$  Rigidity of nut [N/ $\mu$ m]

○ Rigidity of threaded shaft

**F 3.31**

$$R_{s1} = \frac{\pi \times d_c^2 \times E}{4 \times l_1 \times 10^3}$$

fixed – floating/unsupported

**F 3.32**

$$R_{s2} = \frac{\pi \times d_c^2 \times E}{4 \times l_1 \times 10^3} \times \frac{l_2}{l_2 - l_1}$$

fixed – fixed

**F 3.33**

$$d_c = \text{PCD} - D_k \times \cos \alpha$$

- $R_s$  Rigidity of threaded shaft [N/μm]
- $d_c$  Diameter on which the force acts on the ballscrew shaft
- $E$  Elasticity module [N/mm<sup>2</sup>]
- $\alpha$  Contact angle between ball and track [°]
- PCD Ball centre diameter of circle [mm]
- $D_k$  Nominal diameter of ball [mm]
- $l_1$  Distance between bearing and nut [mm]
- $l_2$  Distance between bearing and bearing [mm]

○ Rigidity of nut

The nut rigidity can be checked using an axial force corresponding to the maximum possible preload of 10 % of the dynamic load rating ( $C_{dyn}$ ) (this is listed in the dimensions tables for the nuts). With a lower preload, the nut rigidity can be determined by extrapolation:

**F 3.34**

$$R_n = 0.8 \times R \times \left( \frac{F_{pr}}{0.1 \times C_{dyn}} \right)^{1/3}$$

- $R_n$  Rigidity of nut [N/μm]
- $R$  Rigidity in accordance with dimensions table [N/μm]
- $F_{pr}$  Preload [N]
- $C_{dyn}$  Dynamic load rating from dimensions table [N]

The rigidity of a single nut with play can be calculated as follows with an external axial load of 0.28  $C_{dyn}$ :

**F 3.35**

$$R_n = 0.8 \times R \times \left( \frac{F_{bm}}{0.28 \times C_{dyn}} \right)^{1/3}$$

- $R_n$  Rigidity of nut [N/μm]
- $R$  Rigidity in accordance with dimensions table [N/μm]
- $F_{bm}$  Average operating load [N]
- $C_{dyn}$  Dynamic load rating from dimensions table [N]

The axial rigidity of a feed system includes that of the support bearing and assembly table. The total rigidity should be noted with care when configuring the system.

Fig. 3.24 Rigidity diagram for ballscrews

- $L$  Length of spindle [mm]
- $R_{min}$  Minimum rigidity of spindle [N/μm]
- $R_{tot}$  Total rigidity of feed system
- $R_t$  Rigidity of assembly table
- $R_b$  Rigidity of support bearing
- $R_{bs}$  Rigidity of ballscrew
- $R_s$  Rigidity of threaded shaft
- $R_n$  Rigidity of ballscrew nut
- $R_{nb}$  Rigidity of balls and ball track
- $R_{nr}$  Rigidity of nut/shaft system with radial load

Fig. 3.25 Rigidity factors for feed systems with ballscrews

# Ballscrews

## Structural properties and selection of HIWIN ballscrews

### 3.8.8 Thermal expansion

An increase in temperature in ballscrew shafts during operation impacts on the accuracy of a machine's feed system, since the threaded shaft extends through the thermal stress.

The following factors affect the temperature increase in ballscrews:

- 1) Preload
- 2) Lubrication
- 3) Stretching of the shaft

Fig. 3.26 shows the relationship between operating speed, preload and temperature increase. Fig. 3.27 shows the temperature increase in the nut depending on idle torque.

Ballscrew data R40-10-B2-FDW

- △ = 1,500 rpm with 2,000 N preload
- × = 1,500 rpm with 1,000 N preload
- = 500 rpm with 2,000 N preload
- = 500 rpm with 1,000 N preload

Fig. 3.26 Relationship between operating speed , preload and temperature increase

- Spindle diameter R40
- Lead 10
- Ball diameter 6.35
- Circuits 2.5 × 2
- Speed 2,000 U/min
- Running time 1.5 sec
- Stop time 1 sec

- T<sub>nu</sub> Temperature in nut [°C]
- T<sub>p</sub> Idle torque [Ncm]

Fig. 3.27 Relationship between temperature increase in the ballscrew and idle torque

The thermal expansion of the threaded shaft can be determined using formula F 3.36. The expansion can be compensated by stretching of the shaft. For further information please consult HIWIN.

### F 3.36

$$\Delta L = 11.6 \times 10^{-6} \times \Delta T \times l_{s,total}$$

- ΔL Thermal expansion of threaded shaft [mm]
- ΔT Temperature increase in threaded shaft [°C]
- l<sub>s,total</sub> Shaft length + shaft end (left/right) [mm]

## 3.9 Material and heat treatment

### 3.9.1 Materials of the components

Components	Material numbers according to DIN EN 10027		
	Rolled ballscrews	Peeled ballscrews	Ground ballscrews
Shaft	1.1213	1.1213 1.7225	1.7228
Nut <sup>1)</sup>	1.6523 <sup>1)</sup>		
Ball	1.3505		

<sup>1)</sup> Special nuts 16MnCr5B

### 3.9.2 Heat treatment

Table 3.20 shows the hardness of the main components used in HIWIN ballscrews. The surface hardness of the ballscrew affects both the dynamic and the static load rating. The dynamic and static load ratings listed in the dimensions tables are based on a surface hardness equivalent to HRC 60. For surface hardnesses of less than this, the load ratings can be determined using the following calculation.

F 3.37

$$C'_0 = C_0 \times f_{H0} \quad f_{H0} = \left( \frac{H_R}{60} \right)^3 \leq 1$$

With hardness levels  $f_H$  and  $f_{H0}$   
 $C'_0$  Corrected static load rating  
 $C_0$  Static load rating at 60 HRC  
 $H_r$  Real hardness (HRC)

F 3.38

$$C' = C_{dyn} \times f_H \quad f_H = \left( \frac{H_R}{60} \right)^2 \leq 1$$

$C'$  Corrected dynamic load rating  
 $C_{dyn}$  Dynamic load rating at 60 HRC  
 $H_r$  Real hardness (HRC)

Components	Hardening method	Hardness (HRC)
Shaft	Carburizing	58 – 62
Nut	Carburizing or induction hardening	58 – 62
Ball		62 – 66

### 3.10 Lubrication

HIWIN ballscrews can be lubricated with grease, semi-fluid grease or oil depending on the application. They are supplied preserved as standard and must never be taken into service without initial lubrication. For information about the initial greasing, amounts of lubricant and lubrication intervals, please consult the assembly instructions "Ballscrews".

Lubrication method	Information about checking
Oil	Check oil level once a week and check oil for contamination If contaminated, we recommend changing the oil
Grease	Check grease for contamination every two to three months If contaminated, replace old grease with new grease Always replace grease on an annual basis

# Ballscrews

## Rolled ballscrews

### 4. Rolled ballscrews

#### 4.1 Properties

One of the benefits of rolled ballscrews is that feed systems equipped with them have less friction and are quieter than standard threads.

HIWIN manufactures them using state-of-the-art rolling technologies where the processes of material selection, rolling, heat treatment, machining and assembly are very closely coordinated.

Rolled ballscrews from HIWIN can be flexibly used in virtually all areas of industry. Rolled ballscrew shafts with diameters of 8 mm to 63 mm are always kept in stock and can be supplied at short notice. They can be supplied with or without end machining. Complete bearing units combined with standardised shaft ends enable us to supply complete ballscrews.

#### 4.2 Tolerance classes

Table 4.1 shows the tolerance classes of rolled ballscrews. The lead accuracy is defined using the deviation from nominal path over any 300 mm section of the entire length. The path deviation over the entire useful path is determined by formula F 3.1 on Page 17.

Path deviation	Tolerance class		
	T5	T7	T10
$V_{300p}$	0.023	0.052	0.21

Unit: mm

Nominal diameter	Lead																	Max. shaft length		
	1	1.25	2	2.5	3	4	5	5.08	6	8	10	12	16	20	25	32	40	50	T5	T7, T10
8	○		○	○×	○		○												—	800
10			○	○×	○	○×	○		○		○								600	1,500
12			○	○	○	○×	○×	○		○	○×	○							600	1,500
15							○×				○			○					1,500	3,000
16	○		○	○		○	○×	○	○	○	○×	○	○×	○×		○			1,500	3,000
20				○		○	○×	○	○	○	○×			○×			○		1,500	3,000
25				○		○	○×	○	○	○	○×				○×				2,500	4,500
32					○		○×	○	○	○	○×			○×		○×	○		2,500	4,500
40							○×		○	○	○×	○	○	○×	○		○×		3,000	5,600
50							○×		○		○×	○	○	○×			○×	○	4,000	5,600
63											○×	○	○	○			○		4,000	5,600

Unit: mm

- Right-hand and left-hand thread
- Only right-hand thread
- × Preferred type for right-hand thread with fast delivery in T7
- × Preferred type for right-hand thread with fast delivery in T5 and T7

### 4.3 HIWIN order code for rolled ballscrews

In order to clearly identify the ballscrew, information about the ballscrew shaft and nut is needed.

### Order code for ballscrew shaft without the nut

### Order code for ballscrew nut without the shaft

<sup>1)</sup> Standard; can be omitted with single-thread shafts

## 5. Peeled ballscrews

### 5.1 Properties

In terms of quality, peeled ballscrews from HIWIN fall between rolled and ground ballscrews and can therefore be used for numerous transport or positioning applications. On request, we are happy to produce a lead measurement report for them. A number of nut shapes are available for peeled ballscrews, as both single and double nuts. Customised complete ballscrews can be produced with short lead times. Complete bearing units combined with standardised shaft ends minimise the amount of design work involved.

### 5.2 Tolerance classes

Table 5.1 shows the tolerance classes of peeled ballscrews. The lead accuracy is defined using the deviation from nominal path over any 300 mm section of the entire length.

Path deviation	Tolerance class	
	T5	T7
$V_{300p}$	0.023	0.052

Unit: mm

Nominal diameter	Lead			Max. shaft length <sup>1)</sup>	Max. thread length
	5	10	20		
16	○×			6,000	4,700
20	○×			6,000	5,100
25	○×	○×		6,000	5,100
32	○×	○×	○×	6,000	5,100
40	○×	○×	○×	6,000	5,100
50	○×	○×	○×	6,000	5,100
63		○×	○×	6,000	5,100
80		○×	○×	6,000	5,100

Unit: mm

Larger lengths are available on request

- Right-hand and left-hand thread
- × Preferred type for right-hand thread with fast delivery

<sup>1)</sup> The critical speed and max. buckling force should be taken into account for long shafts.

# Ballscrews

## Peeled ballscrews

### 5.3 HIWIN order code for peeled ballscrews

In order to clearly identify the ballscrew, information about the ballscrew shaft and nut is needed..

### Order code for ballscrew shaft without the nut

### Order code for ballscrew nut without the shaft

<sup>1)</sup> The wiper used is shown in the following tables for the individual nut types. For the DEB-x and DDB-x nut types, you can choose between N, K, F or V wipers, depending on the thread pitch.

Nut designation	Description
DEB-x	Flange single nut with variable wiper type
DDB-x	Flange double nut with variable wiper type
ZE	Cylindrical single nut
SE	Cylindrical single nut with screw-in thread
SEM	Flange single nut with integrated locking nut <sup>2)</sup>

<sup>2)</sup> Simply using a safety nut does not provide sufficient protection against a load being lowered unintentionally. The safety guidelines valid for the application must be observed. The safety nut it is not a safety component according to the Machinery Directive.

## 5.4.5 Safety nut SEM

The safety nut comprises a ball thread unit and safety unit. The safety nut basically works like a normal ballscrew nut. If the axial play is increased due to wear, ball failure or ball loss, the thread of the safety unit comes into contact with the ball thread. The nut cannot therefore break out. The normal function of the unit is guaranteed up to an axial play of 0.4 mm.

### Areas of application:

- Lifting equipment
- Clamping fixtures
- Lifting platforms
- Elevators

- 1 Ballscrew unit
- 2 Safety unit

BP Hole pattern

All dimensions stated without a unit are in mm

### Note:

Simply using a safety nut does not provide sufficient protection against a load being lowered unintentionally. The safety guidelines valid for the application must be observed. The safety nut is not a safety component according to the Machinery Directive.

# Ballscrews

## Ground ballscrews

### 6. Ground ballscrews

#### 6.1 Properties

Of the various production methods used for ballscrews, ground ballscrews offer the greatest accuracy. Ballscrews with a lead accuracy of up to 3.5 µm/300 mm thread length can be produced by grinding after hardening. They are used mainly in machine tools, grinding machines and measuring machines.

Ground ballscrews are always customized, enabling the customer's requirements relating to nut shape, load ratings, preload method, wiper type and end machining to be met. Contact our team for more details.

Below you will find typical standardized nut shapes, nominal diameters and leads. This is just part of our range. We can provide other nut dimensions on request.

#### 6.2 Tolerance classes

Table 6.1 Tolerance classes of ground ballscrews

Path deviation	Tolerance class					
	T0	T1	T2	T3	T4	T5
$e_{2p}$	0.003	0.004	0.006	0.008	0.008	0.008
$e_{300}$	0.0035	0.006	0.008	0.012	0.018	0.023

## 6.3 HIWIN order code for ground ballscrews

In order to clearly identify the ballscrew, information about the ballscrew shaft and nut is needed.

### Order code for ballscrew shaft without the nut

### Order code for ballscrew nut without the shaft

<sup>1)</sup> Standard; can be omitted with single-thread shafts

# Ballscrews

## Ground ballscrews

Table 6.3 Overview of nut shapes

Nut designation	Description
FSC	Flange single nut with cassette recirculation
FDC	Flange double nut with cassette recirculation
FSI	Flange single nut with internal single recirculation
FDI	Flange double nut with internal single recirculation
RSI	Cylindrical single nut with internal single recirculation
RDI	Cylindrical double nut with internal single recirculation

### 6.4 Nuts for ground ballscrews

#### 6.4.1 DIN single nut FSC (DIN 69051 Part 5) with total recirculation

## 7.2 Ballscrews for heavy-duty operation

### 7.2.1 Areas of application

Ballscrews for heavy-duty operation are used in applications such as in injection moulding machines, die casting machines, presses, driving mechanisms and robots.

### 7.2.2 Performance features

#### Can withstand high loads

- Load capacities 2–3 times greater than standard versions
- High load rating for axial loads, good acceleration
- Short travel distance thanks to special design for lubrication

#### Accuracy

- T5 and T7

#### High rapid motion speeds and long service life

- Reinforced ball recirculation systems for use at high speeds and with long service lives

Maximum length: 2 m

S Lubrication hole

# Ballscrews

## Shaft ends and accessories

### 8. Shaft ends and accessories

#### 8.1 Shaft ends and bearing configuration

To reduce the amount of design work required, we provide standardised end machining processes and bearing units. We recommend the "B", "E" and "F" bearing series for simple transport applications and low axial forces. The SFA and SLA bearing units are suited to more challenging precision applications. The WBK series is available for heavy-duty applications.

When selecting the suitable bearing type, the permissible axial force of the fixed bearing must also be taken into account.

Table 8.1 Overview of standard shaft ends for SFA, SLA bearing series

		
<p><b>Supported bearing type S1</b> Bearing: deep groove ball bearing 60.. or 62.. For SLA bearing unit</p>	<p><b>Fixed bearing type S2</b> Bearing: ZKLF.. or ZKLN.. For SFA bearing unit</p>	<p><b>Fixed bearing type S3</b> Bearing: ZKLF.. or ZKLN.. For SFA bearing unit</p>
		
<p><b>Supported bearing type S11</b> Bearing: deep groove ball bearing 60.. or 62.. For SLA bearing unit</p>	<p><b>Fixed bearing type S21</b> Bearing: ZKLF.. or ZKLN.. For SFA bearing unit</p>	<p><b>Supported bearing type S5</b> Bearing: deep groove ball bearing 62.. For SLA bearing unit</p>

**Example:** Designation of shaft end, type S2, with the fit diameter  $d = 20$ : S2-20

When using bearings other than the specified bearing units, it must be checked whether the size of the bearing installation surface is sufficient.

## Shaft ends and accessories

### 8.2 WBK bearing series

series are especially suited to use in heavy-duty ballscrews. Depending on the axial loads present, the WBK bearing units are available with the DF, DFD and DFF bearing arrangements. The bearings are lubricated for life.

The end machining processes suited to the WBK fixed bearing are types W1, W2 and W3 (Section 8.1).

## Shaft ends and accessories

### 8.3 SFA/SLA bearing series

#### 8.3.1 Fixed bearing SFA

The axis height of the fixed bearing is matched to supported bearing SLA (Section 8.3.2) and nut housing GFD (Section 8.4). The pillow block can be screwed on from above (S1) and below (S2).

The reference edge makes it easier to align the unit. The fixed bearing can be pinned with two tapered pins or cylindrical pins. The end machining suited to the fixed bearing is the S2-xx/S3-xx type (Section 8.1).

## 8.8 Axial angular contact ball bearing

### 8.8.1 Angular contact ball bearing ZKLFA

- Double-row angular contact ball bearing in 0 arrangement with 60° contact angle
- Outer ring suitable for flange mounting
- Split inner ring with defined gap for matching of preload
- Lubricated for life for most applications

Housing and shaft tolerances:

Housing

Shaft

The ball cages are made from plastic, permissible operating temperature 120 °C (continuous operation)

<sup>1)</sup> Tightening torque of mounting bolts according to details from manufacturer.

Screws according to DIN 912 are not supplied

### 8.8.3 Angular contact ball bearing ZKLN

- Angular contact ball bearing with 60° contact angle
- Split inner ring with defined gap for matching of preload
- High limiting speeds, even with grease lubrication
- Lubricated for life for most applications
- Lubrication groove and three lubrication holes at the outside surface of the outer ring

Acting on two sides  
Series ZKLN...2RS, ZKLN...ZZ

### Housing and shaft tolerances ZKLN...2RS/...ZZ

### 8.9 HIR lock nuts – radial clamping

#### Type

- Right-hand thread
- Left-hand thread on request.
- The thread and plane surface are produced in a single clamping process
- Thread quality 4H
- HIR lock nuts can be used several times if used correctly

(1) Grub screw, (2) Blocking plug (cut to profile)

## 8.10 HIA lock nuts – axial clamping

### Type

- Right-hand thread
- Left-hand thread on request
- The thread and plane surface are produced in a single clamping process
- Thread quality 4H
- HIA lock nuts can be used several times if used correctly

(1) Grub screw, (2) Blocking plug (cut to profile)

# Ballscrews

## Ball spline

### 9. Ball spline

#### 9.1 Features

The HIWIN ball spline is a rolling guide motion component, mainly composed of a nut(s), a screw shaft, and steel balls in retainers.

The steel balls traveling between the nut and the screw, rolling in infinite cycles, allow the nut to move linearly along the screw shaft with high precision. The steel ball contact point in the ball spline is an angular contact structure, which can withstand both radial and torque load. The integrated nut/bearing design allows the ball spline to achieve high payloads with a compact structure.

The ball spline has three sets of steel balls loaded in retainers, with face-to-face angular contact with the screw shaft. The optimized retainer design provides guided movement with high speed, acceleration and deceleration and secures the steel balls firmly, even when the nut is removed from the shaft.

- Transmission of torque  
The steel balls traveling on the groove with angular contact offer relative movement between the nut and the screw to achieve torque transmission.
- Integral structure  
The integration of the nut and support bearings allows the ball spline to achieve high precision and a compact design.
- Lubricant path  
The optimized lubricant path allows grease to be directly guided to the ball track improving lubrication and increasing service life.

#### 9.2 Structure

### 9.3 HIWIN order code for ball splines

Information on the ball spline shaft and ball spline nut is required for the clear determination of the ball spline.

### 9.4 Nut type FB

#### 9.4.1 Form and positional tolerances

Table 9.1 Form and positional tolerances for nut type FB (1, 2, 3, 4)				
Precision (mm)/ Nominal diameter (mm)	Ballscrew nut		Ball spline nut	
	Verticality (1)	Runout (2)	Verticality (3)	Runout (4)
16	16	20	18	21
20	16	20	18	21
25	18	24	21	21
32	18	24	21	21

Unit:  $\mu\text{m}$

## 9.4.3 FB Type ball spline working mode

$l$ : Ballscrew lead (mm)

-N1: Ballscrew pulley rotating speed (counter-clockwise) ( $\text{min}^{-1}$ )

-N2: Ball spline pulley rotating speed (counter-clockwise) ( $\text{min}^{-1}$ )

$l$ : Ballscrew lead (mm)

N1: Ballscrew pulley rotating speed (clockwise) ( $\text{min}^{-1}$ )

N2: Ball spline pulley rotating speed (clockwise) ( $\text{min}^{-1}$ )

Table 9.4 Work modes FB

Work mode	Motion direction	Input		Shaft motion		
		Ballscrew pulley	Ball spline pulley	Vertical (speed)	Rotating direction (speed)	
	1	Vertical: downward Rotating direction: 0	N1 (N1≠0) (clockwise)	0	V=N1 x l	0
	2	Vertical: upward Rotating direction: 0	-N1 (-N1≠0) (counter-clockwise)	0	V=-N1 x l	0
	1	Vertical: 0 Rotating direction: clockwise	N1 (N1≠0) (clockwise)	N2 (N2≠0) (clockwise)	0	N2 (N2≠0) (clockwise)
	2	Vertical: 0 Rotating direction: counter-clockwise	-N1 (-N1≠0) (counter-clockwise)	-N2 (-N2≠0) (counter-clockwise)	0	-N2 (-N2≠0) (counter-clockwise)
	1	Vertical: upward Rotating direction: clockwise	0	N2 (N2≠0) (clockwise)	V=N2 x l	N2 (N2≠0) (clockwise)
	2	Vertical: downward Rotating direction: counter-clockwise	0	-N2 (-N2≠0) (counter-clockwise)	V=-N2 x l	-N2 (counter-clockwise)

# We Live motion.

**Linear Technology**

**Ball Bearings**

**Linear Motion**

**Linear Guide System**

**Timing Belts**

**Robot**

**Linear Motors**

**Energy Tables**

**Motor & Drive Motor**

**Linear Technology** offers a wide range of linear motion solutions for industrial applications. Our products are designed for high precision, long life, and easy integration. We provide a complete line of linear guides, ball bearings, and linear motors to meet your specific needs. Our products are used in a variety of industries, including automotive, aerospace, and manufacturing.

**Ball Bearings** are essential components in many industrial applications. They reduce friction and support loads, allowing for smooth and efficient motion. We offer a variety of ball bearings, including deep groove ball bearings, tapered roller bearings, and spherical roller bearings. Our bearings are made from high-quality materials and are designed for long life and high performance.

**Linear Motion** solutions are used in a wide range of industrial applications. They provide precise and reliable motion control for a variety of tasks. Our linear motion products include linear guides, ball bearings, and linear motors. We offer a complete line of products to meet your specific needs.

**Linear Guide System** components are used in a wide range of industrial applications. They provide precise and reliable motion control for a variety of tasks. Our linear guide system components include linear guides, ball bearings, and linear motors. We offer a complete line of products to meet your specific needs.

**Timing Belts** are used in a wide range of industrial applications. They provide precise and reliable motion control for a variety of tasks. Our timing belt products include timing belts, pulleys, and timing belt drives. We offer a complete line of products to meet your specific needs.
